Syntax

• Representing a matrix as an array:

```
import numpy as np
matrix_one = np.asarray([
[0, 0, 0],
[0, 0, 0]
], dtype=np.float32)
```

• Multiplying a row by a nonzero constant:

```
matrix[1] = 2*matrix[1]
```

• Adding one row to another row:

```
matrix[1] = matrix[1] + matrix[0]
```

• Combining and chaining row operations:

```
matrix[1] = 0.5*matrix[2] + matrix[1] + matrix[3]
```

Concepts

- Linear algebra provides a way to represent and understand the solutions to systems of linear equations. We represent linear equations in the general form of .
- A system of linear equations consists of multiple, related functions with a common set of variables. The point where the equations intersect is known as a solution to the system.
- The elimination method involves representing one of our variables in terms of a desired variable and substituting the equation that is in terms of the desired variable.
 - Suppose we have the equations and . Since both are equal to , we can substitute in the second function with the first function. The following are the steps to solve our example using the elimination method:
 - 1000 + 30x = 100 + 50x
 - 900 = 20x
 - 45 = x

- A matrix uses rows and columns to represent only the coefficients in a linear system, and it's similar to the way data is represented in a spreadsheet or a DataFrame.
- Gaussian elimination is used to solve systems of equation that are modeled by many variables and equations.
- In an augmented matrix, the coefficients from the left side of the function are on the left side of the bar (), while the constraints from the right sides of the function are on the right side.
- To preserve the relationships in the linear system, we can use the following row operations:
 - Any two rows can be swapped.
 - Any row can be multiplied by a nonzero constant.
 - Any row can be added to another row.
- To solve an augmented matrix, you'll have to rearrange the matrix into echelon form. In this form, the values on the diagonal are all equal to 1 and the values below the diagonal are equal to 0.
